the flame of a lamp, candle, or gas-jet, to direct the flame upon a substance, in order to fuse it, an intense heat being created by the rapid supply of oxygen and the concentration of the flame upon a small area. In its simplest form, as used, for example, by gas-fitters, it is merely a conical tube of brass, glass, or other substance, usually about 7 inches long,  $\frac{1}{4}$  inch in diameter at one end, and tapering so as to have a very small aperture at the other, within 2 inches or so of which it is bent nearly at a right angle. The blowpipe of the mineralogist is provided with a small chamber near the jet, in which the moisture from the mouth collects. The current of air is often formed by a pair of bellows instead of the human breath, the instrument being fixed in a proper frame for the purpose. The most powerful blowpipe is the oxyhydrogen or compound blowpipe, an instrument in which oxygen and hydrogen (in the proportions necessary for their combination), propelled by hydrostatic or other pressure, and coming from separate reservoirs, are made to form a united current in a capillary orifice at the moment when they are kindled. The heat produced is such as to consume the diamond and to fuse or vaporize many substances refractory at lower temperatures. The blowpipe is used by goldsmiths and jewelers in soldering, by glass-blowers in softening and shaping glass, and extensively by chemists and mineralogists in testing the nature and composition of substances. Also called by workmen a *blow-iron*.

Dict.*, "quotes from the 'Painesville (Ohio) Telegraph' of July 6 and Nov. 2, 1827, the word *bogus* as a substantive applied to an apparatus for coining false money. Mr. Eber D. Howe, who was then editor of that paper, describes in his 'Autobiography' (1878) the discovery of such a piece of mechanism in the hands of a gang of coiners at Painesville in May, 1827; it was a mysterious-looking object, and some one in the crowd styled it a 'bogus,' a designation adopted in the succeeding numbers of the paper. Dr. Willard considers this to have been short for *tantrabogus*, a word familiar to him from his childhood, and which in his father's time was commonly applied in Vermont to any

ill-looking object; he points out that *tantara-bobs* is given in Halliwell as a Devonshire word for the devil. *Bogus* seems thus to be related to *bogy*, etc." (*N. E. Figuratively—(a) Fiercely agitated; raging: as, the *boiling* seas. (b) Heated; inflamed; bursting with passion: as, *boiling* indignation.

**Boiling spring**, a spring or fountain which gives out water at the boiling point or at a high temperature. The

most remarkable boiling springs are the geysers, which throw up columns of water and steam; but there are many others in various parts of the world, often associated with geysers, characterized only by ebullition and emission of steam. Some of the latter, as in California and New Zealand, are strongly impregnated with mineral matters and variously colored, while others are charged with liquid mud. See *geyser*.

**boilingly** (boi'ling-li), *adv.* In a boiling manner.

The lakes of bitumen  
Rise *boilingly* higher. Byron, *Manfred*, i. 1.

**boiling-point** (boi'ling-point), *n.* The temperature at which a liquid is converted into vapor with ebullition; more strictly, the temperature at which the tension of the vapor is equal to the pressure of the atmosphere. This point varies for different liquids, and for the same liquid at different pressures, being higher when the pressure is increased, and lower when it is diminished. Under the normal atmospheric pressure (see *atmosphere*) water boils at 212° F. (100° C., 80° R.), and it is found that the boiling-point varies .88 of a degree F. for a variation in the barometer of half an inch. Hence water will boil at a lower temperature at the top of a mountain than at the bottom, owing to diminution in the pressure; a fact which leads to a method of measuring the height of a mountain by observing the temperature at which water boils at the bottom of the mountain and at the top. At the top of Mont Blanc water boils at 185° F. Under a pressure of about  $\frac{1}{15}$  of an atmosphere water would boil at 40° F. while under a pressure of 10 atmospheres the boiling-point would be raised to 356° F. A liquid may be heated much above its true boiling-point without boiling; but the superheated vapor immediately expands until its temperature is reduced to the boiling-point. Hence, in determinations of the boiling-point, the thermometer is never immersed in the liquid, but in the vapor just above it.—**Kopp's law of boiling-points**, the proposition that in certain homologous series of chemical substances each addition of  $\text{CH}_2$  is accompanied by a rise in the boiling-point of about 19.5 C.

It is used by throwing it in such a way that the line winds around the object aimed at, as the legs of an animal. A smaller weapon of the same sort is in use among the Eskimos for killing birds.

The *bolos*, or balls, are of two kinds: the simplest, which is used chiefly for catching ostriches, consists of two round stones, covered with leather, and united by a thin, plaited thong, about eight feet long. The other kind differs only in having three balls united by thongs to a common centre. The Gaucho holds the smallest of the three in his hand, and whirls the other two around his head; then, taking aim, sends them like chain shot revolving through the air. The balls no sooner strike any object, than, winding round it, they cross each other and become firmly hitched. *Darwin*, *Voyage of Beagle*, iii. 50.

—Syn. 3. *Bombast*, *Fustian*, *Bathos*, *Puerilness*, *Pomposity*, *Rant*. "*Bombast* was originally applied to a stuff of soft, loose texture, used to swell the garment. *Fustian* was also a kind of cloth of stiff, expansive character. These terms are applied to a high, swelling style of writing, full of extravagant sentiments and expressions. *Bathos* is a word which has the same application, meaning generally the mock-heroic—that 'depth' into which one falls who overleaps the sublime: the step which one makes in passing from the sublime to the ridiculous." (*De Mille*, *Elements of Rhetoric*, p. 225.) *Bombast* is rather stronger than *fustian*. *Turgidness* and *tumidness* are words drawn from the swelling of the body, and express mere inflation of style without reference to sentiment. *Rant* is extravagant or violent language, proceeding from enthusiasm or fanaticism, generally in support of extreme opinions or against those holding opinions of a milder or different sort.

A, cross-section showing two Haversian canals, a, a, and numerous canaliculi, c, c. B, longitudinal section showing a, a, a, Haversian canals, an b, many c, canaliculi.

consisting of branching cells lying in an intercellular substance made hard with earthy salts (consisting of calcium phosphate with small amounts of calcium carbonate and magnesium phosphate, etc.), and forming the substance of the skeleton or hard framework of the body of most vertebrate animals. When the earthy salts are removed, the remaining intercellular substance is of cartilaginous consistency, and is called osseum or bone-cartilage.

Through the substance of bone are scattered minute cavities—the lacunae, which send out multitudinous ramifications, the canaliculi. The canaliculi of different lacunae unite together, and thus establish a communication between the different lacunae. If the earthy matter be extracted by dilute acids, a nucleus may be found in each lacuna; and . . . not unfrequently, the intermediate substance appears minutely fibrillated. . . . In a dry bone, the lacunae are usually filled with air. When a thin section of such a bone is . . . covered with water and a thin glass, and placed under the microscope, the air in the lacunae refracts the light which passes through them in such a manner as to prevent its reaching the eye, and they appear black. . . . All bones, except the smallest, are traversed by small canals, converted by side branches into a network, and containing vessels supported by more or less connective tissue and fatty matter. These are called Haversian canals.

They are also extensively employed as a ma-

**bookkeeper** (bûk'kê'pér), *n.* One who keeps accounts; one whose occupation is to make a formal balanced record of pecuniary transactions in account-books.

**bookkeeping** (bûk'kê'ping), *n.* The art of recording pecuniary transactions in a regular and systematic manner; the art of keeping accounts in such a manner as to give a permanent record of business transactions from which the true state or history of one's pecuniary affairs or mercantile dealings may at any time be ascertained. Properly kept books show what a merchant has, what he owes, and what is owing to him, as well as what sums he has received and paid, the losses he has incurred, etc. Books are kept according to one of two chief methods, *viz.* by *double* or by *single* entry. The former is more simple and less perfect than the latter, and is now in use chiefly in retail business. In *bookkeeping by single entry*, three books, a day book, a cash book, and a ledger, are commonly used, but the essential book is the ledger, containing accounts under the names of the persons with whom a trader deals, goods or money received from any one of them being entered on one side of the account, called the credit side, and goods sold or money paid to that person being entered on the opposite or debit side of the account. In *bookkeeping by double entry*, the ledger accounts are of two kinds, personal accounts such as those just described, and book-accounts, in which the commodities dealt in are made the subjects of separate accounts, and have a debit and a credit side, as in personal accounts. Thus, if a trader purchase 100 bales of cotton from A. B., the account in the ledger headed A. B. is *credited* with 100 bales of cotton, so much, while the account headed Cotton is *debited* with the same quantity and amount; should the trader sell 10 bales to C. D., the account headed C. D. is *debited* with 10 bales at so much, and the account headed Cotton is *credited* with 10 bales; and so on. These book-accounts are based on the principle that all money and articles received become debtors to him from whom or to that for which they are received, and, on the other hand, all those who receive money or goods from us become debtors to cash or to the goods. In this way every transaction is entered in the ledger on the creditor side of one account and on the debtor side of another. The books used in double entry vary in number and arrangement according to the nature of the business and the manner of recording the facts. Transactions as they take place from day to day are generally recorded in such books as the stock-book, cash-book, bill-book, invoice-book, and sales-book, or they may all be recorded in order in a waste-book or day-book. Upon these books or additional documents are based the journal and ledger. The former contains a periodical abstract of all the transactions recorded in the subordinate books or in documents not entered in these, classified into debits and credits, while the latter contains an abstract of all the entries made in the former, classified under the heads of their respective accounts.

This species of tenure has given rise to the modern freeholds.

The title *tenancy in bookland* was based upon the possession of a *boc*, or written grant.

*D. W. Ross, German Land-holding, Notes, p. 170.*

This process of turning public property into private went on largely in later times. The alienation was now commonly made by a document in writing, under the signatures of the King and his Witan; land so granted was therefore said to be *booked* to the grantee, and was known as *bookland*.

*E. A. Freeman, Norm. Conq., I. 64.*

*W. E. Griffiths, in N. A. Rev., CXX. 283.*

3. One who makes a book (see *book*, *n.*, 9) on a race or other doubtful event; a professional betting man. See *extract*.

In betting there are two parties—one called "layers," as the *book-makers* are termed, and the others "backers," in which class may be included owners of horses as well as the public. The backer takes the odds which the *book-maker* lays against a horse, the former speculating upon the success of the animal, the latter upon its defeat; and taking the case of Cremorne for the Derby of 1872, just before the race, the *book-maker* would have laid 3 to 1, or perhaps £1000 to £300 against him, by which transaction, if the horse won, as he did, the backer would win £1000 for risking £300, and the *book-maker* lose the £1000 which he risked to win the smaller sum. At first sight this may appear an act of very questionable policy on the part of the *book-maker*; but really it is not so; because, so far from running a greater risk than the backer, he runs less, inasmuch as it is his plan to lay the same amount (£1000) against every horse in the race, and as there can be but one winner, he would in all probability receive more than enough money from the many losers to pay the stated sum of £1000 which the chances are he has laid against the one winner, while yet it is . . .

In later use some assume also an allusion to *boom<sup>2</sup>*, *n.*, 3. When a boom of logs breaks, the logs rush with violence down the stream, and are then said to be "booming"; but this appears to be the ordinary ppr. adj. *booming*, roaring, rushing with violence, and to have no connection with *boom<sup>2</sup>*, *n.* or *v.*] **I. intrans.** To go on with a rush; become suddenly active; be "lively," as business; be prosperous or flourishing. (The earliest instance of the word in this sense appears to be in the following passage:

"The Republicans of every other State are of the same way of thinking. The fact is, the Grant movement (for a third term of the presidency) is booming."

*J. B. McCullagh*, in *St. Louis Globe-Democrat*, July 18, 1878.

The idea I wished to convey was that the Grant movement was rising—swelling, etc. The word seemed to be a good one to the ear, and I kept it up. It was generally adopted about a year afterward. I used it as a noun after a while, and spoke of 'the Grant boom.'"

Boomerangs.

Australia, consisting of a rather flat piece of hard wood bent or curved in its own plane, and from 16 inches to 2 feet long. Generally, but not always, it is flatter on one side than on the other. In some cases the curve from end to end is nearly an arc of a circle, in others it is rather an obtuse angle than a curve, and in a few examples there is a slight reverse curve toward each end. In the hands of a skilful thrower the boomerang can be projected to great distances, and can be made to ricochet almost at will; it can be thrown in a curved path, somewhat as a bowl can be "screwed" or "twisted," and it can be made to return to the thrower, and strike the ground behind him. The opposite of boorish is refined or polite, the opposite of churchish is churchy. It is a white crystalline solid, slightly soluble in cold water, having a sweetish alkaline taste. It occurs in nature in solution in the water of lakes in Tibet, Tataria, China, and California, and is obtained from these waters by evaporation and crystallization. The United States is now almost wholly supplied with borax from California. Borax is also prepared artificially from soda and boric acid. It is much used as a flux in assaying operations, and for cleaning the surfaces of difficultly fusible metals previous to soldering, since when melted it dissolves the metallic oxides which form on their surfaces when heated. It is also used in glass and enamel manufacture; as an antiseptic, particularly in foods, because its action on the system is feeble even in comparatively large doses; and as a detergent. Crude borax is also called *tincal*.—Glass of borax. See *glass*. Honey of borax. See *honey*.

(d) In *her*, the outer edge of the field when of different tincture from the center. Its width is uniform, and should be one fifth the width of the field. French heralds consider the border as one of the ordinaries; in English heraldry it is sometimes a mark of difference. The border always covers the end of any ordinary, as the chevron, fess, etc. When a coat of arms is impaled with another, if either of them has a border, it is not carried along the pale, but surrounds the outside of the field only. The border when charged with an ordinary shows only so much of the ordinary as comes naturally upon that part of the field occupied by the border; thus, the cut represents a border paly of six pieces, azure and argent.

F. *barre*, a bore); prob. < Icel. *bāra* = Norw. *bæra*, a billow caused by wind; cf. Sw. dial. *bår*, a hill, mound; prob. connected with Icel. *bera* = E. *bear*.] An abrupt tidal wave which breaks in an estuary, the water then rushing up the channel with great violence and noise. The tidal wave being a wave of translation, the shoaling and narrowing of channels where the tide rises very rapidly produce a great increase in the height of the wave. The forward parts of the wave, too, in shoaling water advance less rapidly than the backward parts, and so cause a great accumulation in front. The most celebrated bores in the old world are those of the Ganges, Indus, and Brahmaputra. The last is said to rise to a height of 12 feet. In the Amazon and other rivers in Brazil the boats reach a height of from 12 to 16 feet. In England the bore is observed more especially in the Severn, Trent, and Wye, and in the Solway Firth. The bores in some bays at the head of the Bay of Fundy are very remarkable. In some parts of England it is called *eager* (which see); on the Amazon, the *prorooa*; on the Seine, the *barre*; and on the Gironde and Dordogne in France, the *masseret*.

When the rise of the tide begins, the surface of the water is disturbed in mid-channel; but the water is not broken, it is merely like a common wave. But as this rapid rise elevates the surface suddenly above the level of the flat sands, the water immediately rushes over them with great velocity, and with a broken front, making a great noise. And this is the whole of the bore.

Airy, *Encyc. Metrop.*, Tides and Waves, p. 514.

**bore**<sup>3</sup> (bôr), *v. t.*; pret. and pp. *bored*, ppr. *boring*. [This word, verb and noun (the noun in senses 1 and 2 appar. preceding the verb), came into use about the middle of the 18th century; usually considered a particular use of *bore*<sup>1</sup>, and compared with G. *drillen*, bore, drill, also bore, weary; but an immediate derivation from *bore*<sup>1</sup> is philologically improbable, though it may be explained as a twist of fashionable slang (to which, indeed, the word has always belonged), perhaps resting on some forgotten anecdote. At any rate, the word is now independent of *bore*<sup>1</sup>.] **1.** To weary by tedious iteration or repetition; tire, especially in conversation, by insufferable dullness; tease; annoy; pester.

**botany** (bot'a-ni), *n.* [Early mod. *E.* also *botanie*, formed from *botanic*, as if *< Gr. βοτάνη*, a rare var. of *βοτάνη*, an herb, grass, fodder, *< βοτάνω*, feed, mid. *βοτάνομαι*, feed one's self; cf. *L. vesci*, eat.] The science of plants. It treats of the forms of plants, their structure, the nature of the tissues of which they are composed, the vital phenomena connected with them, the arrangement of them into larger and smaller groups according to their affinities, and the classification of these groups so as to exhibit their mutual relations and their position in the vegetable kingdom as a whole. The science further investigates the nature of the vegetation which at former epochs lived on the earth, as well as the distribution of plants at the present time. It is thus divided into several sections. (a) *Structural or morphological botany*, that branch of the science of botany which relates to the structure and organization of plants, internal or external, independently of the presence of a vital principle. Also called *organography*. (b) *Physiological or biological botany*, that branch which relates to the history of vegetable life, the functions of the various organs of plants, and their minute structure and method of growth. (c) *Descriptive botany*, that branch which relates to the description and nomenclature of plants. Also called *phenology*. (d) *Systematic botany*, that branch which relates to the principles upon which plants are to be classified or arranged with reference to their degrees of relationship. The system of classification now universally adopted is that proposed by Antoine Laurent de Jussieu, and improved and enlarged by De Candolle, Brown, and others. It is generally called the *natural system*, because it is intended to express, as far as possible, the various degrees of relationship among plants as they exist in nature, and to group next to each other the various species, genera, and orders which are most alike in all respects. Several artificial systems have been proposed, as that of Tournefort, based on the modifications of the corolla; but the best-known is that of Linnaeus, founded on the stamens and pistils. This system, which was designed by Linnaeus to be only temporary, proved of great value to the science of botany, but it has now gone entirely out of use, or is used only as a partial index to the *vascular kingdom*. (e) *Geographical botany*, that branch which relates to the natural distribution of plants over the globe, and to the inquiry into the causes which have influenced or modified this distribution. (f) *Palaeobotany or fossil botany*, that branch which embraces the study of the forms and structures of the plants found in a fossil state in the various strata of which the earth is composed.

=*Syn.* *Boundary*, *Bound*, *Border*, *Confiner*, *Frontier*. A *boundary*, in its stricter sense, is a visible mark indicating a dividing-line between two things, or it is that line itself; it marks off a given thing from other things like in kind, as one field or country from another. A *bound*, on the other hand, is the limit or furthest point of extension of one given thing, that which limits it not being specially considered; it can be used of that which is not limited by anything like in kind: as, the *boundaries* of a field, but the *bounds* of space; the *boundaries* of a science, but the *bounds* of knowledge. Hence the figurative uses of *bound*: as, "Believe I speak within bounds, where boundaries would be absurd." Thus, the *bounds* of a parish may be defined by certain marks or boundaries, as heaps of stones, dikes, hedges, streams, etc., separating it from the adjoining parishes. But the two words are often interchangeable. A *border* is a belt or band of territory lying along a *bound* or *boundary*. A *confine* is the region at or near the edge, and generally a narrower margin than a *border*. A *frontier* is a *border* viewed as a front or place of entrance: as, he was met at the *frontier*. The word is used most in connection with military operations: as, their *frontiers* were well protected by fortresses.

**Bovidæ** (*bō'vi-dē*), *n. pl.* [*NL.*, < *Bos* (*Bov-*), ox, + *-idæ*.] A family of hollow-horned ruminants, the ox tribe, containing the bovines. The family was formerly nearly coextensive with the genus *Bos* in a large sense, including cattle as distinguished from goats, sheep, and antelopes. In this acceptance the family corresponds to the modern subfamily *Bovinae*. It has been found impossible, however, to draw any sharp dividing line between cattle and other hollow-horned ruminants, among some of which, as the antelopes, connecting links occur. Therefore, notwithstanding the familiar difference between an ox and a sheep, for example, or a goat and an antelope, the family *Bovidæ* now contains all of these which have hollow, persistent horns, common to both sexes, generally two, sometimes four, and certain common cranial characters by which they collectively differ from the saiga on the one hand and from the pronghorn on the other, these two so-called antelopes being made respectively the types of the families *Saigidæ* and *Antilocapridæ*. The *Bovidæ* as thus defined are conventionally divided into five subfamilies: *Bovinae* (cattle); *Orobovinae* (muskoxen); *Ovinae* (sheep); *Caprinae* (goats); and *Antilopinae* (antelopes). See these words.

They are of large size and more or less massive form. The head is carried low upon a short neck, the legs are relatively short, with the cannon-bones little or no longer than the phalanges, the hoofs broad, the muzzle naked, the horns simple and unbranched, and the tail tufted at the end. There are four inguinal teats. The leading genera are *Bos*, *Rubidus*, *Auro*, *Bison*, and *Porcupinus* or oxen, buffaloes, bisons, and yaks.

2. A weapon consisting of a strong strip of elastic wood or other elastic material, with a string stretched between its ends, used for shooting arrows. When the bow has been bent to its full extent by pulling the string back from it, the recoil of the string (against the inner side of which the notch of the arrow is placed) when released impels the arrow. The bow and arrow have been used in all ages and by many peoples as a weapon, and, though superseded in the advance of civilization by firearms, are still in use among savage tribes, and are the officially recognized weapon of the Manchu garrisons of China, where archery is still one of the subjects of examination for officers in the regular army. Bows were at one time divided into *longbows* and *crossbows*. During the middle-ages the nations of Europe used longbows of 5 or 6 feet in length, the shorter ones being used by horsemen, and the longer by the foot-archers. The bows now commonly used in archery are of two kinds, the single-piece bow, or self-bow, and the back or union bow. The single-piece bow is made of one rod of hickory, lance-wood, or yew, the last, if perfectly free from knots, being considered the most suitable wood. The union bow is made of two or sometimes three pieces glued together. See cuts under *archer's bow*, *hornum*, and *crossbow*.

These, being rubbed with resin and drawn over the strings of the instrument, cause it to sound. (b) An implement consisting of a piece of wood curved, and having a string extended from one extremity to the other, used (1) by smiths in turning a drill, (2) by turners in turning wood, and (3) by hatters in preparing fur and wool for their use.

Unknown in the older sacred literature, *Brahma* becomes by degrees an object of adoration to the Brahmans and is artificially combined into a triunity or trinity with *Vishnu* and *Siva*, being regarded as Creator, while *Vishnu* is Preserver, and *Siva* is Destroyer. *Brahma* was never worshipped by the people, and only one temple sacred to him is known. tissue: the encephalon (which see); the part of the cerebrospinal axis which is contained in the cranium. It is divided by anatomists into (1) the *prosencephalon*, comprising the cerebral hemispheres

Base of Human Brain.

A, frontal lobe of cerebrum; B, temporal lobe of same, separated from A by the sylvian fissure; C, corpus callosum; its fore end, *ch.* cerebellum; D, medulla oblongata; E, pyramidal body; F, olfactory nerve; G, optic nerve, after decussation with its fellow at the chiasm; H, trigeminal nerve; I, facial nerve; J, auditory nerve; K, glossopharyngeal nerve; L, vagus nerve; M, accessory nerve; N, hypoglossal nerve. The rounded masses near O are the corpora albicantia; P rests upon the pons Varolii.

ley and others the *encephalon* of the above nomenclature is called *metencephalon*, and the next segment (the fifth) is then named *myelencephalon*. Common English equivalents of the above five segments are *forebrain*, *midbrain*, *hindbrain*, and *afterbrain*; these are terms translated directly from the nomenclature of the German anatomists, who call them respectively  *Vorderhirn*, *mittelhirn*, *hinterhirn*, and *nachhirn*. Haeckel calls them *protosphele*, *mesosphele*, *metasphele*, and *episphele*. These five segments are fundamentally distinct, and correspond embryologically to as many cerebral vesicles or brain-bladders which arise from three primitive vesicles by subdivision. The simplest and a common division of the brain is into the *cerebrum* or brain proper, the *cerebellum* or little brain, the *pons Varolii*, and the *medulla oblongata*. (See cuts under *cerebral* and *corpus*.) The human brain is distinguished for the relatively enormous size and surface-complexity of the cerebrum or prosencephalon, which completely covers the cerebellum and olfactory lobes, and is marked by many deep fissures or sulci separating gyri or convolutions. The cerebrum is divided into right and left halves, or cerebral hemispheres, connected by the great transverse commissure or corpus callosum. Each hemisphere is divided into three primary lobes, frontal, parietal, and occipital, and many more detailed subdivisions of its surface are recognized. The interior of the brain (which is primitively hollow) is traversed in the adult by a set or system of connected cavities known as *ventricles* or *cavities*. The first and second of these are the right and left ventricles of the hemispheres, or *proleventricles*; the third is the *diacele*; the fourth is the *epicelle*; passages connecting these are the foramina of Monro and the aqueduct of Sylvius. The brain and adjoining portions of the spinal cord give rise to 12 pairs of nerves, called *cranial nerves* because they emerge from foramina in the base of the skull. (See *cranial*.) Brain-substance is of two kinds, gray ganglionic or cellular nerve-tissue, and white commissural or fibrous nerve-tissue. The gray matter which invests the cerebrum and cerebellum is also called the *cortical substance*, in distinction from the white or *medullary substance* of the interior. A brain is in fact a collection of gray ganglia united by white commissures. Besides the cortex, there are several ganglia or collections of gray matter in the interior, as the *corpora striata*, the optic thalami, the optic lobes or *corpora quadrigemina*, the *corpora dentata* of the cerebellum, and the *corpora olivaria* of the medulla oblongata. Connected with the brain are two non-nervous structures, the conarium or epiphysis cerebri and the pituitary body or hypophysis cerebri. The brain is covered by three membranes or *meninges*, of which the external is the dura mater, the middle the arachnoid, and the inner the pia mater. Most mammals have a brain like that of man, but in descending the mammalian scale the cerebrum becomes relatively smaller and has fewer if any convolutions, the corpus callosum becomes rudimentary, and the olfactory lobes enlarge. (See cuts under *gurus* and *sulcus*.) In the brain of birds the hemispheres are smooth, there is no corpus callosum or pons Varolii, and the optic lobes are of immense size. There is no brain in the lowest vertebrate, *Amphioxus*. The average weight of the brain in adult males of the European type is about 1,400 grams (49.5 ounces); in women about 1,250 grams (44 ounces). The brain is in its highest activity the organ of consciousness or mind, and its general function is that of furnishing the most complex and extensive outgoing stimulation of muscles and other active tissues as a response, more or less immediate, to the most complex and extensive incoming sensory stimulation. With functions of this high degree of complexity are associated in some parts much simpler functions resembling those of the spinal cord. The cortex of the cerebral hemispheres is the portion of the brain in which the most complex coordinations seem to be effected, and which is most directly involved in mental acts. Certain parts of the cortex are, however, peculiarly related to certain special incoming or outgoing stimulations, and are called sensory or motor centers. (See *cerebral*, and *cerebral localization*, under *localization*.) The corpus striatum is usually regarded as especially concerned with stimulations passing downward, and the optic thalamus with those passing upward, among

the latter, those of sight are connected with the hinder part of the thalamus. The nates are involved in the sight-function, and the testes seem to have close relations with the stimuli entering by the auditory nerve. The cerebellum is concerned with the coordination of muscular contractions in the carrying out of voluntary actions, while the medulla oblongata contains a large number of centers for comparatively simple functions, as vasomotor action, cardiac action, respiration, deglutition, etc. (See also cut under *encephalon*.) From its complexity, the brain is usually spoken of in the plural in certain relations: as, to beat out or to rack one's *brains*.

2. In *entom.*, the principal ganglion of the nervous system, situated in the head, over the esophagus, and formed by the coalescence of several supra-esophageal ganglia. The nerves of the eyes and antennae are directly connected with it, and it gives off two inferior branches which surround the esophagus and unite beneath in the subesophageal ganglion. Sometimes this ganglion is regarded as a part of the brain, being distinguished as the *cerebellum*, while the principal or upper ganglion is called the *prothorium*.

3. The same or a corresponding portion of the nervous system in many other invertebrates.—

the medium of water. They are highly vascular, with a well-developed circulation of the blood by the gills, the water which comes in immediate contact with them. They are developed from different parts of the body in different classes of animals. See *gill*, and cut under *Polybranchia* and *Tubibranchia*.

2. In *Arthropoda*, as crustaceans, specifically, the externally projecting processes of the body or its limbs, which are supplied with venous blood (which is thus brought into contact with the air dissolved in water), and constitute a special respiratory organ. See cut under *Polybranchia*, other kinds of respiratory organs in arthropods are *trachea*, *trachea*, and *pulmonaria*. See these words.

3. In *Vermes*, any appendages of the head or body so modified as to act as a respiratory organ; the various processes which protrude or radiate from the head or other region of the body, and have, or are supposed to have, a respiratory function. See cut under *Protula*.

Newport.

**branchial** (brang'ki-al), *a.* [*< NL. branchialis, < L. branchiæ, gills: see branchiæ.*] 1. Performed by means of branchiæ: as, *branchial respiration*; a *branchial function*.

**Branchial aperture**, the aperture or outlet for water which has supplied the branchiæ, lying behind them. In fishes there are 2, one on each side; rarely the two are confluent in a single inferior aperture. In selachians they are generally in 5 pairs, rarely in 6 or 7. In myzonts they are usually in 7 pairs, rarely 6 or more than 7, and sometimes confluent in an inferior pair of "pores." In invertebrates they vary.—**Branchial arch**, in fishes, one of the arches of the branchial apparatus which support the branchial filaments on each side.—**Branchial bar**, the hardened portion of the branchial apparatus which supports the gills: same as *branchial arch*. **Branchial basket**. See *basket*, 10.—**Branchial cavity**, or **branchial chamber**. (a) The cavity on each side of which are the branchiæ: it is behind and generally confluent with the oral cavity. (a) In some systems of classification, one of the prime divisions of the *Arthropoda*, by which all crustaceans, in a broad sense, are collectively distinguished from the *Tracheata*, or insects in the widest sense (arachnids, myriapods, and insects proper): so called from having a branchial instead of a tracheate respiratory apparatus. In Gegenbaur's system a third prime division, *Protobranchiata*, established for *Peripatius* alone, intervenes between *Branchiata* and *Tracheata*. The *Branchiata* are primarily divided into *Crustacea* proper (including the two main groups of *Entomostraca* and *Malastraca*) and *Pachypoda*, represented by *Limulus*, etc. (b) A division of vertebrates containing those which for some time or permanently breathe by gills: the amphibians and fishes, as distinguished from reptiles, birds, and mammals: synonymous with *Ichthyopsida* (which see). (c) In mollusks, same as *Branchiogasteropoda*. Respiration may be effected in three ways: first, the blood may be simply exposed to the water in the thin walls of the mantle-cavity, as in some of the *Heteropoda*; secondly, the respiratory organs may be in the form of outward processes of the integument, exposed in tufts on the back and sides of the animal, as in the *Nudibranchiata*, such as the sea-slugs, etc.; and thirdly, the respiratory organs may be in the form of pectinated or plume-like branchiæ, contained in a more or less complete branchial chamber formed by an inflection of the mantle, as in the whelks, etc. The *Branchiogasteropoda* fall into two distinct series, the one being hermaphrodite, with the gills placed toward the rear of the body, and the other having the sexual organs in distinct individuals. The *Branchiogasteropoda* are divided into three orders: (1) *Prosobranchiata* (sexes distinct, gills usually inclosed), as whelks, etc.; (2) *Opisthobranchiata* (sexes usually united in the same individual, gills often exposed), as sea-slugs, etc.; (3) *Heteropoda* (free-swimming gastropods), as members of the genus *Carnaria*.

In Latreille's system of classification, the first order of his *Entomostraca*, characterized as having a mouth composed of an upper lip, two mandibles, a tongue, and one or two pairs of maxillæ, and the branchiæ more or less anterior: so called because their branchiæ or gills are situated on the feet. The order thus defined was divided into two sections: (1) *Lophyropoda* (*Ceremonida*, *Ostracoda*, and *Cladocera*); (2) *Phyllopusia* (*Cratophthalma* and *Aspidopoda*).

2. As defined by Huxley, a group of entomostracous *Crustacea*, embracing only the two groups *Phyllopusia* and *Cladocera*. It is represented by such genera as *Apus*, *Nobilia*, *Branchipus*, *Limnæus*, *Daphnia*, and their allies, which pass into one another so gradually that the groups *Phyllopusia* and *Cladocera* can hardly be established. ME. *bras*, *bres*, < AS. *bras*, *bras* = Icel. *bras* (Haldorsen), solder (> Gael. *bras* = Ir. *bras* = W. *pres*, brass); related to Icel. *brasa*, harden in the fire, = Sw. *brasa*, flame, = Dan. *brase*, fry, > F. *braser*, solder (see *brace*<sup>1</sup>); cf. OSw. and Sw. *brasa*, fire, Icel. *brass* (occurring once), a cook. Hence *brase*<sup>2</sup>, *brazen*, *brassen*, etc.] I. *n.* 1. An important alloy, consisting essentially of copper and zinc. The proportion in which the two metals are combined differs considerably in different kinds of brass. Brass in general is harder than copper, and consequently wears better than that metal. It is malleable and ductile, so that it can be easily rolled into thin sheets, or be hammered into any desired shape. It turns easily in the lathe, and can be drawn into fine wire; moreover, it has an attractive golden color, and is cheaper than copper. The color of brass varies with the proportions of the ingredients. A full yellow variety contains about two parts of copper to one of zinc. This alloy was known to the ancients, and was made by them before they had any knowledge of the metal zinc as such. It is not among the metallic substances mentioned by Homer; but it was well known to Strabo, who describes the mode of manufacturing it from the zinkiferous ore (calamine), and calls the alloy *corinthia cupra*, *galkra*. See *corinthia*, *pinkish*, *prince's metal*, *mosaic gold*, *Moor's metal*, and *yellow metal*. In rhetorical comparisons, brass is a common type of hardness, durability, or obduracy.

4. In *medieval archeol.*, a funeral monument consisting of a plate of brass, usually of rectangular shape and often of large size, incised with an effigy, coats of arms, inscriptions, and frequently accessory ornament. Such *brasses* are sometimes splendidly enameled. In some examples the designs are executed in relief, or in relief in combination with engraving. Slabs of stone inlaid with figures, etc., in brass are also called *brasses*, and are a usual form of medieval monument. Both the plates of brass and the inlaid stones were frequently placed in the ordinary pavement of churches. Comparatively few of such monuments executed wholly in brass survive, as the value of the metal has caused it to be melted down and applied to other uses.

**Syn. 1.** *Gallant*, *Valiant*, *Courageous*, *Brave*, *Heroic*, *valorous*, *dareless*, *chivalrous*, *dauntless*, *resolute*, *manly*. *Gallant*, splendid in dress or qualities, is most appropriately used with regard to courage which exhibits itself in deeds attracting attention and applause; of the first four words it is that which may have in it most of compliment and least of high commendation, but it is often a strong word, expressing splendid bravery in action: as, he was a *gallant* officer. *Valiant* is also brave in action, especially in opposing physical force, as in battle. The word is now elevated and poetic. *Courageous* denotes the possession of that spirit which enables one fearlessly and with full presence of mind to face danger. *Brave* is the most comprehensive of the words; it may denote the possession of the highest and noblest kind of courage and fortitude, of that spirit which enables a man to bear up against evil and danger, as well as to go forth to face it. *Courageous* has much of this breadth of meaning, but is applicable rather to doing than to enduring; *brave* is both passive and active. *Heroic* combines the meaning of all the other words in the superlative degree. It indicates a lofty superiority to fear, a noble self-forgetfulness, an almost superhuman power to dare, achieve, or suffer. It bears the same relation to the other words that *sublime* bears to *great*, *grand*, or *lofty*.

It consists of prayers or offices to be used at the canonical hours, and is an abridgment of the services of the early church, which from their great length were exhausting. It is made up largely of the Psalms, passages of the Old and New Testaments and the fathers, hymns, anthems, etc., all in Latin, arranged for the various seasons and festivals of the church. A similar book, known as a *portiforium* or *portass*, was in use in England before the Reformation. The Order for Morning and Evening Prayer in the English Book of Common Prayer is mainly a translation and condensation from the breviary according to the use of Sarum. Besides the Roman breviary, which is in most common use, there are also others of various ar-

rangement, either of certain religious orders or local, often of historical interest.

piece, fragment, this being referred to the AS. *brice*, *bryce*, a piece, fragment (cf. F. dial. *brique du pain*, equiv. to AS. *hlafes brice*, a piece of bread); but neither of the two Teut. forms, Icel. *brīk* (with long vowel), a tablet, etc., MD. *brijke* (with long vowel), MD. MLG. *bricke* (with short vowel), a brick, tile, plate, etc., agrees in sense or form with the AS. *brice*, *bryce*, a piece, fragment, and its cognates, nor can either be brought into connection with the primitive verb of the latter (Icel. *breka* = MD. MLG. *breken* = AS. *brecan*, E. *break*), except perhaps through the medium of the OF. But the sense of 'brick,' which does not belong to the AS., G., and Scand. forms, is a derived one; cf. the explanatory synonyms *brickstone*, *brick-tile*. The MD. and MLG. cognates of the AS. *brice*, *bryce* (E. *breach*, dial. *brick<sup>1</sup>*, *breck*, *q. v.*) are different: see *breach*. Cf. Bricks in the United States and Europe are generally red (see *brick-clay*), but some clays produce yellowish bricks, as for example the *Milwaukee brick* much used as an ornamental building material in the United States. The bricks made in China and Japan are invariably of a slaty-blue color. [*Brick* is used in the singular collectively for bricks in the mass or as a material.]

Perhaps akin to *brow*; cf. *OBulg. brŭvi*, a bridge, also *brow*; see *brow*.] 1. Any structure which spans a body of water, or a valley, road, or the like, and affords passage or conveyance. Bridges are made of various materials, principally stone, iron, and wood, and in a great variety of forms. In an *arch* or *arched bridge* the passage or roadway is carried by an arch or arches, which are supported by abutments or by piers. Such bridges are constructed of brick, stone, iron, steel, or wood. Brick is seldom used alone, except

for comparatively small spans, and for unimportant work when stone cannot readily be obtained. In more important works it is often combined with stone, which is introduced to bind, to distribute pressure, to protect the more exposed portions, and for architectural effect. Stone, wherever it can be used, is the most valuable material, on account of its massiveness, stability of form, and resistance to the elements; but it is inferior to iron in economy of facility of construction, and ready adaptability to various situations. Among the finest monuments of antiquity are ranked the remains of Roman and Indian stone bridges. The largest stone

arch known is that of the bridge of the Washington aqueduct over the Cabin John Creek (span 220 feet; rise 57.25 feet); the next is that over the river Dee at Chester (span 200 feet; rise 42 feet). The first arch bridge built of iron was erected over the river Severn, in England, and consists of 5 parallel ribs of cast-iron, with a span of 100 and a rise of 40 feet. The Southwark bridge over the Thames at London, the central one of the three arches of which has a span of 240 with a rise of 24 feet, formerly ranked as the largest iron arch bridge; but this span has since been more than doubled, as notably in the bridge over the Mississippi at St. Louis, and the Washington bridge over the Harlem river in New York city. In an *arched-beam bridge* arched beams in compression constitute the

Arched-beam Bridge.

principal members and sustain the load. The beams are sometimes built of parallel layers of planks, which are made to break joint. In the more important constructions the arches are often compound. They have been employed in modern bridges of considerable magnitude. An *arched-truss bridge* is a form in which the compression-member is an arched beam, as in the McCallum truss. In a *beam-truss bridge* the load is supported by beam-trusses or openwork beams. A compression-chord and a tension-chord are essential, and the stresses are transferred from one to the other on their way to the points of support by means of struts and tension-bars, which together are called web-members. See phrases below for other forms.

2. The upper line or ridge of the nose, formed by the junction of the two nasal bones.—3. In *engraving*, a board resting on end-cleats, on which the engraver rests his hand in working. In etching two bridges are used: one with low feet or cleats, to serve for work on the unbiten plate; the other with higher feet, to raise it above the bordering-wax after it has been applied.

4. A wall, generally made of fire-brick, which is built at both ends of a reverberatory furnace, to a certain height, in order to isolate the space in which the metallurgical operation is conducted. The wall nearest the fireplace is called the *fire-bridge*; the other, at the opposite end, the *flue-bridge*.

—6. In *metal.*, the platform or staging by which ore, fuel, etc., are conveyed to the mouth of a smelting-furnace.—7. That part of a stringed musical instrument over which the strings are stretched, and by which they are raised above the sounding-board. In bow-instruments, such as the violin, the bridge is arched, in order to allow the bow to strike any one string without touching the others.

8. *Naut.*, a raised platform extending from side to side of a steamship above the rail, forward of amidships, for the use and convenience of the officer in charge. It affords him an uninterrupted view, and is furnished with means for communicating, by automatic signals, with the engine-room and the wheel-house. Many large vessels have two bridges, one forward of and one abaft the mainmast; and it is now very common for the bridge to be made in two tiers, one above the other, with often an outlook-station still higher than the upper tier. In side-wheel steamers the bridge connects the paddle-boxes.

See *pons asinus*.—*Bottom-road bridge*, a bridge whose roadway is supported upon the lower chord in a truss-bridge, or at the bottom in a tubular bridge. Also called *through bridge*. Op-

When piers are used to support the beam-trusses, they are placed near the center of each truss, and not, as in ordinary truss-bridges, at its ends. The strains due to a load upon the span are carried outward toward the ends of the bridge and beyond the piers by bracket-arms similar to those forming the central span, the extremities of which may be secured to other piers to serve the twofold purpose of resisting by their weight the

uplift caused by the load when upon the central span and of themselves supporting vertical pressure; or they may form part of other spans similar to the central one. This form of bridge presents the great advantage of permitting the construction of the main span without scaffolding beneath. A fine example is the cantalliver bridge below Niagara Falls, built for the Michigan Central and Canada Southern railways.—**Check-bridge of a furnace**, a fire-bridge; so called because it was supposed to check the draft.—**Counterpoise bridge**, a bascule-bridge in which counter-weights help to raise the platform.—**Electric bridge**, a term applied to several contrivances for determining the resistance of an electric circuit, all essentially identical with Wheatstone's bridge (which see, under *resistance*).—**Floating bridge**. often formed by two equal spans, covering a channel on each side of the pivot-pier.—**Pontoon bridge**, a platform or roadway supported upon pontoons. Bridges of this kind are largely used in military operations, the pontoons being formed of air-tight bags or hollow metallic vessels.

—**Rope bridge**, a hanging bridge consisting of a platform supported by ropes, or simply of a rope carried across the stream or chasm, and supporting a basket or car which is drawn backward and forward. Such bridges are used in mountainous districts, especially in India and South America, and are sometimes made of sufficient strength to afford passage to droves of loaded mules. The ropes are often made of plaited thongs of hide, or even of rushes.—**Suspension-bridge**, a roadway suspended from ropes, chains, or wire cables, usually hung between massive towers of masonry, and securely anchored at the extremities. The most notable of suspension-bridges is that between New York and Brooklyn, over the East River. The roadway is suspended from four cables of steel wire, each 15½ inches in

for comparatively small spans, and for unimportant work when stone cannot readily be obtained. In more important works it is often combined with stone, which is introduced to bind, to distribute pressure, to protect the more exposed portions, and for architectural effect. Stone, wherever it can be used, is the most valuable material, on account of its massiveness, stability of form, and resistance to the elements; but it is inferior to iron in economy of facility of construction, and ready adaptability to various situations. Among the finest monuments of antiquity are ranked the remains of Roman and Indian stone bridges. The largest stone

**II. n.** [*Cf. F. brillant*, a diamond.] **1.** The form in which the diamond and other precious stones are cut when intended to be used as ornaments, whenever the shape and cleavage of the uncut stone allow this to be done without too much loss of material. The brilliant is susceptible of many small modifications as regards the size, proportions, and even the number of the facets; but in the most perfect cut there are 58 facets. The general shape of all brilliants is that of two pyramids united at their bases, the upper one being so truncated as to give a large plane

and is formed by removing one third of the thickness of the stone; the opposite small end, called the *culet* or *collet*, is formed by removing one eighth of the thickness of the stone. The *girdle* is the widest part, and forms the junction-line between the upper part, called the *crown*, and the lower part, called the *pavilion*. Fig. 2 shows the top (*a*), side (*b*), and back (*c*) views of a modern brilliant cut with 58 facets. *T* is the table; *C*, the culet; *G*, the girdle; *A*, the temple or bezels (of which there are 4 in all); *B*, the upper quoin or lozenge (of which there are 4); *S*, star-facets (of which there are 8 in the crown); *E*, skill- or half-facets (8 in the crown and the same number in the pavilion); *D*, cross- or skew-facets (8 in each part); *P*, pavilion-facets (4 in number); *Q*, lower or under-side quoin (of which there are 4)—making 58 facets in all. Sometimes extra facets are cut around the culet, making 66 in all. In fig. 3, *a* and *b* show top and side views of the single cut, or half brilliant; *c* is a top view of the old English single cut. In fig. 4, *a*, *b*, and *c* show top, side, and back views of a brilliant with 42 facets. In fig. 5, *a*, *b*, and *c* show top, side, and back views of the split or double brilliant, with 74 facets. In fig. 6, *a*, *b*, and *c* show top, side, and back views of the Portuguese cut, which has two rows of rhomboidal and three rows of triangular facets above and below the girdle. In fig. 7, *a* gives a side view of the double rose, sometimes called the *briolette* when several more rows of triangular facets are added. Fig. 8 shows

the form and size of the famous Regent diamond, belonging to the government of France. It weighs 136½ carats, and is generally considered the most valuable diamond known, having been estimated by experts at twelve million francs. It comes very near being a perfect brilliant in form, but is a little too thick or deep for its breadth, while the Koh-i-noor, as cut since it came into the possession of the Queen of England, is too thin or spread. Any gem may be cut in brilliant form; but when the word **brilliant** is used by itself, it is always understood to mean a diamond.

An alloy of which copper forms the predominating portion, and into the composition of which tin almost always enters: but the name is also given to alloys containing no tin. The proportion of copper in various bronzes is usually between 80 and 90 per cent.; in some it falls as low as 70. The proportion of tin in the bronzes of different ages and those used for various purposes is almost as variable as that of copper. Bronze used for bells has the largest amount of tin; in some it reaches 25 per cent. The bronze formerly used for cannon contained about 10 per cent. of tin and often a small amount of zinc. Statuary bronze is, and has been from the beginning of its use for the purpose, of very variable composition. In some statuary called bronze there is less than 1 per cent. of tin, while zinc is present in sufficient quantity almost to justify calling the material brass. The zinc in various pieces of statuary cast within the past two or three hundred years, and erected in some of the principal cities of Europe, varies in quantity from less than 1 per cent. to 25. Lead is present in many bronzes, but usually in small amount, rarely being as much as 3 per cent. Bronze is an alloy of importance to both the arts and commerce, and is also of great historical interest, since it has been known from remote ages over a large part of the world. It is preferred to simple unalloyed copper, on account both of its color and of its greater durability. Among prehistoric races the use of bronze preceded that of iron; and among their remains are found swords, axes, and other cutting instruments of this material, sometimes artistically made and ornamented, as well as domestic implements and utensils of many kinds. The ancient Greeks, Romans, etc., made statuary of it in enormous quantities, and also coins, recording tablets, and a great variety of articles of common use. It is now not only used for cannon (for which purpose it has been to a great extent supplanted by steel), bells, and statuary, but also for parts of various machines, especially bearings, and for screw-propellers. The beauty and durability of bronze statuary depend in no small degree on the color and composition of the oxidized film or incrustation which forms upon it when it is exposed to the weather. This is called its *patina* (which see). In recent times numerous experiments have been made with a view to improve the quality of bronze in various ways, in particular by the addition of small quantities of other substances, especially metals. The most important result of these experiments seems to be *phosphor-bronze*, an alloy patented by two Belgian metallurgists about 1870, and now extensively used where toughness and resistance to wear are required. The amount of phosphorus in phosphor-bronze is less than 1 per cent., and the effect it produces is probably due to its reducing action on the oxids of the other metals during the process of manufacture. Phosphor-bronze is of finer grain and color, and is believed to be much more durable than ordinary bronze; and it is thought by many that it will eventually be proved to be the best material for artillery. Extensive experiments have also been made with manganese, lead, and other metals. *Aluminium bronze* is an alloy of copper and aluminium now in use, especially where tensile strength is required. So-called *steel bronze* is bronze hardened by mechanical compression. It has not come into general use, but was intended by its inventor to be used for cannon. See *aluminium*.

The refusal of Spain to enter into commercial relations with England made the privileges of the company worthless; but by means of a series of speculative operations and the infatuation of the people its shares were inflated from £100 to £1,000. Its failure caused great distress throughout England.

*N. A. Rev.*, CXXVII. 164.

=Syn. *Bulky*, *Massive*, *Massy*, *Ponderous*, *Burly*. *Bulky* refers to prominence, excess, or unwieldiness of size; it applies properly to material things; if applied to persons, it implies the development of physical size at the expense of higher qualities. *Massy* is, strictly, poetic for *massive*. The two denote weight and solidity quite as much as size, while that which is *bulky* may be hollow and comparatively light: as, a *bulky* bundle of straw; a *massive* jaw; "ingots of *massy* gold." *Ponderous* primarily denotes weight and not size, but has come to have a secondary suggestion of unwieldiness. *Burly* is applicable only to persons, and expresses bigness, solidity, and force, with something of coarseness of manner.

In 1603, Jonson produced his mighty tragedy of *Sejanus*, a noble piece of work, full of learning, ingenuity, and force of mind in wielding *bulky* materials.

Same as *bullo*, 2.

—2. The most authoritative official document issued by the pope or in his name: usually an open letter containing some decree, order, or decision relating to matters of grace or justice. It derives its name from the leaden seal (Latin *bullo*) appended to it by a thread or band, which is red or yellow when the bull refers to matters of grace, and uncolored and of hemp when it refers to matters of justice. On one side of the seal is the name of the pope, and on the other are the heads of St. Peter and St. Paul. Bulls are written in Latin, either in the ordinary cursive hand or in round Gothic characters, and have a red seal on the parchment itself, in which the name of the pope encircles the heads of the apostles. They begin with the name of the pope, followed by the term *episcopus* (bishop) and the words *servus servorum Dei* (servant of the servants of God), and a salutation, and close with the place and date of execution and the subscription of the chancellor or other functionary of the papal chancery. The distinctive name of a bull is taken from the first word or words of the general introduction which follows the salutation: as, the *bull Unigenitus*, which begins with the words *Unigenitus Dei*, etc., issued in 1713 by Clement XI., condemning the Jansenist propositions set forth in Quenel's "Moral Reflections." A brief, though of equal authority with a bull, differs from it in several important points, chiefly of form. It is shorter, relates to subjects of inferior importance, is written in Latin in ordinary Roman letters and on the smooth side of the parchment, uses the word *papa* instead of *episcopus* in the introductory formula, is sealed with red wax instead of lead, and with the pope's private seal, the fisherman's ring, and is never signed by the pope himself, but by a secretary of the papal chancery. Both bulls and bulls belong to a class of papal documents generically called *apostolic letters*; these are *encyclical* when addressed to the bishops of the Roman Catholic world, and from their contents are called *constitutions*, *decretales* (ancient), *synodal letters* (also ancient), *rescripts*, *notus proprii*, etc. *Consistorial bulls* are issued after consultation with the consistory of cardinals, and are signed by all the cardinals consulted.

The church published her bulls of crusade; offering liberal indulgences to those who served.

3. An official letter; an edict; especially, an imperial edict under the Roman or the old German empire.—*Golden bull*, a name given to several celebrated historical documents, from their golden seal. The most notable of these is an edict or imperial constitution made in 1356 by the emperor Charles IV., regulating the mode of procedure in the election and coronation of the emperor.—*Leaden bulls*, the designation of official documents (from their leaden seals) sent by the emperors of Constantinople to patriarchs and princes, by the grandees of the empire, of France, Sicily, etc., and by patriarchs and bishops.

*bull*<sup>4</sup> (bül), n. [Not found earlier than the 17th century, except as ME. *bul* (about A. D. 1320) in the doubtful passage first quoted. Origin uncertain. Several anecdotes involving Irish speakers have been told (and appar. invented) to account for the word. It is usually associated with *bull*<sup>2</sup>, a papal edict, in allusion, it is said, to the contrast between the humble professions of the pope, as in his styling himself 'servant of servants,' and the absolutely dictatorial nature of his edicts. This explanation, which rests partly on the passage quoted from Milton (cf. *bullish*<sup>2</sup>, also in Milton), below, is hardly tenable on historical grounds. The Icel. *bul*, nonsense, *bullo*, talk nonsense, chat, is mod., and, if not from the E. word, is to be associated with *bullo*, boil, and ult. with L. *bullo*, a bubble: see *bull*<sup>3</sup>.] A gross inconsistency in language; a ludicrous blunder involving a contradiction in terms: commonly regarded as especially characteristic of the Irish, and often called an *Irish bull*.

Hind. *bulbulla*, *bulbulla*, a bubble, and E. *bubble*, etc.; all perhaps orig. imitative.] 1. An ornament in the form of a capsule or locket, in use among the ancient Romans, who adopted it from the Etruscans. It was worn especially around the neck as an amulet by Roman children, both boys and girls, its protective virtue being supposed to reside rather in its precious material or in some substance inclosed within it. It was of gold in the families of the nobly born and the rich, and of common material among others. It was laid aside by young men upon attaining maturity, and dedicated to Hercules or to the household lares; by young women it was dedicated to Juno.

(b) By recent writers it is restricted to the bubble-shells, so called from their ventricose oval shells, so convoluted that the last whorl envelops all the others: typical of the family *Bullidae*. Specifically—2. A small metallic projectile intended to be discharged from a firearm: commonly limited to leaden projectiles for small arms.

Bullets were formerly always spherical in form, but many changes have been made in them in both shape and structure. The bullet used for rifles of recent construction is elongated and conical, or rather ogival, at the apex, somewhat like half an egg drawn out, with a hollow at the base, into which a plug of wood or clay is inserted, and with small cuts (cannelures) in the metal outside, which are filled with beeswax to lubricate the barrel while the bullet is passing through it. When the gun is fired the plug is driven forward to the head of the cavity, forcing the base of the bullet outward till the lead completely fills the grooves in the rifled barrel. The plug is often omitted, the base of the bullet being forced into the grooves by the expansive force of the powder.

**Burden of proof**, in law, the obligation resting upon one of the parties to an action to establish an alleged fact by proof, under penalty of having judgment given against him, according to the presumption recognized by the law of evidence in case he adduces no proof. The burden of proof is said to be shifted when the party upon whom it lay has produced sufficient evidence to turn the presumption in his favor. Two circumstances are essential to the existence of a burden of proof: first, there must be a question of fact between two parties before a tribunal which will render a decision whether there is any particular evidence or not; and second, this decision must be governed by rules of presumption, more or less artificially extended so as to lead to a determinate result in every case. In forensic controversies there will or will not be a burden of proof, according as these conditions are or are not fulfilled. In reasonings, as contradistinguished from disputations, if they relate to policy, there is nothing to which the term *burden of proof* is applicable; for the decision will be based on considerations of likelihood, economy, safety, etc., but never on formal rules of presumption. A general habit may be followed when decided reasons fail, in questions both of policy and of morals; but the phrase *burden of proof* is not employed in such cases. A speculative or scientific inquiry, on the other hand, cannot be closed until satisfactory evidence has been obtained or curiosity dies out; so that the term *burden of proof* has no meaning in such a connection. Yet an individual reasoner who, being impatient of doubt, insists on adopting an answer to each question, however blank our ignorance of the facts, must often resort to a merely formal presumption; and such persons say that there is a burden of proof upon any possible advocate of the hypothesis which they propose to reject without proof. The term is also used in cases where the absence of observations of a certain kind is itself a significant fact. Thus, we may say that there is a burden of proof upon the evolutionists to explain our not finding forms intermediate between recognized types; that is to say, the non-occurrence of such observations is a fact to be taken into account.—*Syn.* Weight, incumbrance, clog, incubus, *burden*, *burthen*, *burden*.

A dry measure, containing 8 gallons or 4 pecks. The imperial bushel legally established in Great Britain in 1826 has a capacity of 2,218.192 cubic inches, and holds 80 pounds avoirdupois of distilled water at the temperature of 62° F. with the barometer at 30 inches. Previous to this the Winchester bushel had been the standard measure from Anglo-Saxon times; its capacity was 2,150.42 cubic inches. The measures of capacity of the United States are founded on the Winchester bushel, the imperial system having been created since the separation of the two countries. The name *Winchester bushel* is derived from the fact that the ancient standard bushel-measure of England was preserved in the town-hall of Winchester. Numerous bushels were in use in England at the time of the adoption of the imperial system. Thus, by a statute of Anne, a bushel of coals is to contain a Winchester bushel and a quart of water, to be 19½ inches in diameter, and to be heaped in the form of a cone 6 inches high. Various equivalent weights of different commodities had also been made bushels by law. Many of the American States have established equivalent weights, which vary considerably in different States. This use is also extended to constructions not originally negative.

To the last two constructions, respectively, belong the idioms "I cannot but hope that," etc., and "I can but hope that," etc. The former has suffered ellipsis of the principal verb in the first clause: "I cannot do anything but hope," or "anything else than hope," or "otherwise than hope," etc., implying constraint, in that there is an alternative which one is mentally unable or reluctant to accept, *but* being equivalent to *otherwise than*. The latter, "I can but hope that," etc., has suffered further ellipsis of the negative, and, though historically the same as the former, is idiomatically different: "I can only hope that," etc., implying restraint, in that there is no alternative or opportunity of action, but being equivalent to *only, not otherwise than, or no more than*.

NGr. *βύρις*, a pan for salting meat). As in other vessel-names, the precise application varies in the different languages. In the sense of a particular measure of wine, the word is modern; cf. *pipe* in similar senses.] 1†. A leathern bottle or flask; a bucket: in this sense only in Middle English, usually spelled *bit* or *bitt*.

English Gilds (E. E. T. S.), p. 382.

2. A large cask, especially one to contain wine.

—3. A measure of wine equal to 126 United States (that is, old wine) gallons; a pipe. It is no longer a legal measure in Great Britain, and the common statement that an imperial butt is 126 imperial gallons is incorrect; the butt is 110 imperial gallons. The measure was originally used chiefly for Spanish wine, and the word was used to translate Spanish *bota*, which equaled 126 United States gallons, and to distinguish that from the Spanish *pipa*, which contained only 114 United States gallons. Its present value was legalized by a statute of Anne. It is now confounded with the *pipe*. The pipe of Madeira is reputed to contain 110 gallons; of Canary, 120; of Port, 138; of Marsala, 112. The *bota* and *pipa*, throughout Spain, vary but little from the values above given. In Portuguese countries two measures are common, one of 141 gallons (Oporto, Lisbon for oil), and another of 110 gallons (Lisbon, Madeira, Porto Rico, Bahia). There is besides a Portuguese pipe of 132 gallons (Lisbon for oil, Bahia). In Italy the name *botte* is applied to a cask holding 200 United States gallons or more; but it was in many places confounded with the *pipa*, which held only 160 to 170 gallons. The French word *botte* was never used as the name of a wine-measure; neither was the German *butte* or *butte*. In Denmark there was a *bodde* of 123 United States gallons; in Gotha, a measure of the same name equal to 115 United States gallons. The *botija* of Bolivia is only 9.3 United States gallons. A butt of London beer, at the time when London beer was measured differently from ale, was 3 hogheads. A butt of salmon, by a statute of Henry VI., was 84 gallons.

4. A beehive. [Prov. Eng. (Exmoor).]—5. A cart. [Prov. Eng.]

**butte** (bü), *n.* [F., a rising ground, a mound, orig. a butt to shoot at: see *butt*<sup>2</sup>.] A conspicuous hill or mountain, especially one that attracts attention by its isolation, or serves as a landmark: a name applied in the regions about the upper Missouri and west to the Pacific. Thus, the "Three *Battes*" were a conspicuous landmark for emigrants to Oregon. One of the highest and grandest mountains in the United States, Mount Shasta, was in the early days of Californian emigration known to the Americans almost exclusively as *Shasta Butte*. Other prominent lofty peaks in California are still called *battes*, as Downieville *Battes*, Marysville *Battes*, etc. This use of the word *butte*, now gradually disappearing from the region in question, is a relic of French occupancy of the Northwest, and of the subsequent wide distribution through that region of the Hudson's Bay Company's employees, most of whom were of French extraction. The word was picked up by overland emigrants and carried to the furthest West; and it has been much used as a place-name, alone or in combination.

It is used as a food or relish by most peoples, and is made directly from the milk, or from the cream previously separated from the milk, of cows, goats, and other animals. Agitation or churning separates the fats from the milk or cream and makes them cohere in lumps, which are then worked together, freed as far as possible from buttermilk, and usually mixed with salt, which preserves the butter and develops its flavor.

The name of *ghee* (which see) is given to a kind of run butter made in India. — **Vegetable butters**, a name given to certain concrete fixed vegetable oils which are solid at common temperatures: so called from their resemblance to butter produced from the milk of animals. The following are the most important of them. *Cacao butter*, or oil of theobroma, is obtained from the seeds of the cacao (*Theobroma cacao*) of tropical America; it is "a yellowish-white solid, having a faint agreeable odor, a bland chocolate-like taste, and a neutral reaction" (U. S. Dispensatory, p. 1049). *Custard butter* is obtained from the fruits of *Vateria indica*; it is a resin rather than an oil, and is used as a varnish. *Fulva butter* is from the seeds of the East Indian *Bassia butyrosa*; *Kokum butter*, from the seeds of *Garcinia indica*; *Maharaj butter*, from *Bassia latifolia*. *Shor butter*, also called *gahm* or *Banabuk butter*, is from the kernels of the shea-tree, *Butyrospermum Parkii*, of western Africa; it resembles palm-oil, but is of a deeper-red color. *See* *Bassia*, *cacao*, *shea*.

that empire by the Turks in A. D. 1453. It spread so widely that its influence even in Italy did not wholly decline before the fifteenth century, and it may be considered as surviving still in Russian architecture, and in a less marked degree in other eastern lands. An almost universal feature of the style, in buildings of any pretension, is the incrustation of brick or rough stonework with more precious materials; large spaces are left void of bold architectural features, to be rendered interesting merely by surface ornament of polished marbles presenting natural beauty of hue, or of sculpture in very low relief, and confined in the main to vegetable or geometrical designs of clearly cut outline. The style depends much on color for its effect, and mosaics wrought on grounds of gold or of positive color are profusely introduced. The leading forms which characterize the Byzantine style are the round arch, the circle, the cross, and the dome supported upon pendentives. The capitals of the pillars are of endless variety, and full of invention. While some are plainly founded on the Greek Corinthian, many resemble those of early round-arched western architecture; and so varied is their decoration that frequently no two sides of the same capital are alike. The ancient basilica of St. Sophia, in Constantinople, and the church of St. Mark, in Venice, are classical examples of Byzantine architecture.—**Byzantine historians**, a series of historians and chroniclers of the affairs of the Byzantine empire, scattered through the whole period of its existence. They are our only source of knowledge of Byzantine history. Their works have been several times printed complete in the original Greek, the latest edition being by Niebuhr and others, in 48 volumes.

1. The third letter and second consonant in the English, as in general in the other alphabets derived from the Phœnician. The value of the sign, however, in Phœnician as in Greek, was that of a hard *c* (in *ca, acer*); and so also originally in Latin, beside the sign *k*, which had the proper *k*-sound. But the Latins gave up for a time the written distinction of the *k* sound from the *c* sound, writing both with the same character, *C*; and when later they adopted the distinction, instead of reducing *C* to its original value, and restoring *k*, they retained the *c*-value for the *c*, and added a tag to the same character for the *k*-sound, thus turning *C* into *G*. The comparative table of forms, like that given for the other letters (compare *A* and *B*), is as follows:

Egyptian Hieroglyphic.	Phœnician.	Early Greek and Latin.

Great as is the apparent difference between Greek *Γ* and our *C*, it is due only to a shifting of the position of the angle made by the two component lines, and the rounding of this angle. The hard or *k*-sound which belonged to this character in early Latin belonged to it also in Anglo-Saxon (which, like Latin, made little or no use of *k*). But this *k*-sound, as being a guttural or back-palatal mute, is particularly likely to be shifted forward along the tongue and to be changed into front-palatal and sibilant sounds, especially before vowels like *e, i, y*, which favor the front-palatal position. Hence it comes that *c*, still so written, is pronounced as *s* in English before *e, i, y*, and elsewhere as *k*. But this "soft" or sibilant *c* belongs to the French part of our language; the Anglo-Saxon *c*, when softened, gets the sound usually represented in English by *ch*, and is so written: for example, in *chicken, cheese, church, birch, teach*. (See *ch* and *assimilation*.) No word containing *c* pronounced *s* is of Anglo-Saxon origin, except a few misspelled, as *cinder* for *sinder*, and *once, twice*, etc., *peace, mice*, etc., having *ss* for original *cs*, *ss*. (See *cel*.) For the sounds of *ch*, see *ch*.

2. As a numeral, in the Roman system, *C* stands for 100, and is repeated up to *CCCC*, 400 (followed by *D*, 500). This symbol, originally *Ϟ*, that is, the Greek theta (Θ), was afterward reduced to *C* and understood to stand for *centum*, a hundred.

3. As a symbol: (a) In music: (1) Used in English and German to designate the key-note of the natural scale. See *natural* and *scale*. (2) When placed on the staff immediately after the clef, a sign of common time, each measure containing 4 quarter notes or their equivalent. When a vertical line is drawn through it, it indicates alla breve time, each measure containing 2 or 4 half notes, played more quickly than in common time. (3) On the keyboard of the organ or pianoforte, the white key or digital next to the left of each group of two black keys. The middle *C* of the keyboard is a usual starting point in the reckoning of both keys, tones, and notes; it is also known as *alto C*, or *c*; the next *C* below is called *tenor C*, or *c*; the second *C* below, *bass c*, or *C*; and the next *C* above, *treble C*, or *c*, etc. The present pitch of middle *C* is from 250 to 265 vibrations per second; it is often theoretically fixed in Germany at 256, in England at 256, and in France at 251. About 1700 it was actually about 240, and in recent times as high as 275. The major scale of *C*, because it comprises all the white keys and none of the black ones, is taken as the normal or standard scale of the keyboard. (b) In the mnemonic means of moods of syllogism, the symbol of reduction *per impossibile*. (c) In *math*, *C* is used to denote a constant of integration. See also *A*, 2 (c), (d), (e). (d) In *chem*, the symbol for *carbonyl*.

4. As an abbreviation, *c*, or *C*, stands, in dental formulas of zoology (*c*), for *canine tooth*; in United States money (*c*), for *cent*; in thermometer-readings (*C*), for *centigrade*; in French money (*c*), for *centime*; in references (*c*), for *chapter* (or Latin *capitulum*); in dates, before the number (*c*), for Latin *circa*, about; in meteorology (*c*), for *cirrus*; in a ship's log-book (*c*), for *cloudy*; and in measures of volume (*c*), for *cubic*.—Middle *C*, in music, the note on the first ledger-line above the bass or below the treble staff. (See above.)

A cab came clattering up. Thackeray.

With great difficulty Messrs. Bradshaw & Rotch (the latter a member of Parliament) obtained licences for eight cabriolets in 1823, and started them at fares one third lower than those of hackney coaches. The new vehicles were hooded chaises, drawn by one horse, and carrying only one passenger besides the driver, who sat in the cabriolet (or, as more commonly called for brevity, the *cab*) with his fare. . . . The name *cab* is still commonly applied to all hackney carriages drawn by one horse, whether on two or four wheels. Pennycuik.

It was equal to 2.021 liters, or 4 $\frac{1}{4}$  United States pints. Other statements appear to be due to confusion of different measures by Greek metrologists; but a *great cab*, of  $\frac{3}{4}$  the ordinary size, is mentioned in the Talmud.

They besieged it [Samaria] until an ass's head was sold for fourscore pieces of silver, and the fourth part of a *cab* of doves dung for five pieces of silver. 2 Ki. vi. 25.

The measuring of the temple, a *cabal* found out but lately. B. Jonson.

3. Conjoint intrigue; secret artifices of a few persons united in some design: as, "curs'd *cabals* of women," Dryden.

Centuries glide away in the same unvaried round of *cabals* at court. Brougham.

4. A number of persons united in some close design, usually to promote their private views in church or state by intrigue; a *junto*. The name of "the *Cabal*" was given to an unpopular ministry of Charles II., consisting of Clifford, Ashley, Buckingham, Arlington, and Lauderdale, the initials of whose names happened to compose the word.

These ministers were therefore emphatically called the *Cabal*; and . . . it has never since their time been used except as a term of reproach. Macaulay, Hist. Eng., ii.

**Syn.** 4. *Combination, Party, Faction, Cabal, Camarilla, Junto*. *Combination* is the most general of these words, but it expresses least of permanence in organization; it often denotes the union for special ends of individuals or parties otherwise antagonistic: as, the Democrats and Greenbackers entered into a *combination* to secure the election. A *party* is strictly a more close and permanent union of individuals, organized to promote certain principles or common interests which they consider of fundamental importance: as, the Low Church *party*, the Republican *party*; but the term is more loosely used where organization is wanting: as, the Free-trade *party*. *Combination* and *party* may express that which is entirely reputable; the other words are chiefly unfavorable in their signification. A *faction* is commonly a section of a party; it is generally a comparatively small number of individuals, whose principles and objects are often of a captious, frivolous, or selfish nature, but advocated so persistently as to be annoying, and with so little regard to the general interest as sometimes to be dangerous. *Cabal* and *junto* express a union less comprehensive than *party* or even *faction*; the intrigues of a *cabal* or *junto* are usually conducted mainly for the personal aggrandizement of its members. *Junto* has almost entirely given place to *cabal* in modern use. A *camarilla* is a more or less united body of secret counselors of a ruler, acting generally in opposition to his official advisers, and constituting a "power behind the throne."

After numerous abortive attempts and unsuccessful combinations in which Newcastle bore the chief part, it became evident . . . that the union . . . of Newcastle . . . and Pitt was absolutely necessary.

Lecky, Eng. in 18th Cent., viii.

If I could not go to heaven but with a *party*, I would not go there at all. Therefore I protest to you I am not of the *party* of federalists.

Jefferson, Correspondence, II. 439.

By a *faction*, I understand a number of citizens, whether amounting to a majority or minority of the whole, who are united and actuated by some common impulse of passion, or of interest, adverse to the rights of other citizens, or to the permanent and aggregate interests of the community. Madison, Federalist, No. 10.

In a simple monarchy, the ministers of state can never know their friends from their enemies; secret *cabals* undermine their influence and blast their reputation. J. Adams, Works, IV. 289.

Sw. *kabbala*), a transcription of Heb. *qabbālāh*, reception, the cabala or mysterious doctrine received traditionally, < *qabal*, receive, take, in the Piel conjugation *qibbel*, receive (a doctrine). Hence *cabal<sup>1</sup>*.] 1. The theosophy or mystic philosophy of the Hebrew religion, which grew up mainly after the beginning of the tenth century, and flourished for many generations. The cabala employed itself first in a mystic explanation of deity and cosmogony, and in the creation of hidden meanings for the sacred Hebrew writings, thus drawing into its province all the Hebrew law and philosophy. Later cabalists pretended to find wonderful meanings even in the

letters and forms of the sacred texts, and made for themselves elaborate rules of interpretation.

One versed in or engaged in the study of the cabala or mystic philosophy of the Jews. The cardinal doctrines of the cabalists embrace the nature of the supreme Being, the Divine emanations or Sephiroth, the cosmogony, the creation of man, psychology, the destiny of man and the universe, and the import of the revealed law. The cabalists seem to have endeavored to identify all such sciences as demonology, astrology, chiromancy, sympathetic medicine, etc., with their theosophic mysticism, weaving the whole into a secret universal wisdom or esoteric philosophy of the universe. They sympathized with many points of Christianity, so that in the fifteenth and sixteenth centuries the cabala was by many thought highly important as a proof of Christianity and as a means of converting the Jews.

The Cabalists had a notion, that whoever found out the mystic word for anything attained to absolute mastery over that thing. Lowell, Among my Books, 1st ser., p. 158.

In Great Britain, though the executive government is vested nominally in the crown, it is practically in a committee of ministers called the *cabinet*, which is of comparatively modern development. Every cabinet includes the First Lord of the Treasury, who is generally chief of the ministry, or prime minister, the Lord High Chancellor, the Lord President of the Council, the Chancellor of the Exchequer, and the five Secretaries of State, with two or more other members, at the prime minister's discretion. In the United States the *cabinet* is a collective popular name, not recognized by law, for the heads of the eight executive departments, namely, the Secretaries of State, the Treasury,

War, the Navy, the Interior, and Agriculture, the Postmaster-General, and the Attorney-General. They are appointed by the President, by and with the advice and consent of the Senate, and are removable at the President's pleasure. They have as a body no legal functions, but by custom meet the President at stated times for consultation. The term *cabinet* is also sometimes applied to the executive council of a governor or of a mayor.

The insulating layers are generally separated from the outer wires by a padding of jute or hemp saturated with tar or other protective substance.
